OBJECTIVE

The purpose of this test is to characterize VOC and formaldehyde emissions from a flexible ventilation duct according to ISO 16000 standards and to check the compliance of their emissions with mandatory requirements in France:

- ✓ VOC emission class according to French labelling system (Decree n° 2011-321 of March 23, 2011 and Order of April 19, 2011 modified by Order of February 20, 2012),
- ✓ absence of release of CMR compounds (Orders of April 30, 2009 and May 28, 2009).

According to CSTB quotation n° 26056011

1. Description of test samples

This test report is concerning the SONOAFS-ALU.70 ECOSOFT ventilation duct from the AFS BORU SANAYI A.S. company.

Test sample reference	Laboratory reference	Receipt of test sample	Start of testing		End of testing
			Preparation of test specimen	Introduction in test chamber	
SONOAFS-ALU.70 ECOSOFT	Pol-15-03	02/03/2015	3-3-215 10:30	03/03/2015 ; 12:15	31/03/2015 ; 12:17

Table 1 : Description of test sample

2. Preparation of the test specimen

For this test, AFS provided CSTB with a flexible ventilation duct (length = 2 m, internal diameter = 0.203 m). For the preparation of the test specimen, CSTB has cut and opened one piece of this duct in order to fix it on a glass plate (internal face apparent). The external face and edges of the ventilation duct were covered using a low emission adhesive (Figure 1). Dimensions of the test specimen was 0.486 m per 0.133 m. Therefore, the emitting surface of the prepared test specimen was 0.065 m².

Figure 1 : Test specimen of SONOAFS-ALU.70 ECOSOFT ventilation duct (internal face)

3. Emission test chamber conditions

Just after preparation, the test specimen has been introduced in a glass emission test chamber. Testing parameters are presented in Table 2.

Test parameters	Test chamber conditions
Emission test chamber type	CLIMPAQ (glass)
Emission test chamber volume	0.0509 m ³
Temperature	22.3 ± 0.7 °C
Relative humidity	48.0 ± 3.5 %
Test specimen surface	0.065 m ²
Air flow rate	0.077 m ³ .h ⁻¹
Air exchange rate	1.51 h ⁻¹
Product loading factor	1.27 m ² .m ⁻³
Area specific air flow rate (q _{test})	1.19 m ³ .m ⁻² .h ⁻¹
Test duration	28 days

Table 2 : Testing conditions

4. VOC and formaldehyde sampling conditions

VOC and aldehyde (ALD) active sampling were performed in duplicate by pumping air through respective sorbents just before beginning of the test (day 0) and 28 ± 2 days (day 28) after introduction of the test specimen in the emission test chamber. Sampling conditions are presented in Table 3.

Sampling conditions	VOC	VOC	ALD
Number of sampled tubes	1	1	2
Sorbent type	Tenax TA	Tenax TA	DNPH
Sampling duration	60 min.	60 min.	60 min.
Sampling air flow rate	50 mL.min ⁻¹	75 mL.min ⁻¹	600 mL.min ⁻¹
Sampled air volume	3.0 L	4.5 L	36.0 L

Table 3 : Sampling conditions

5. VOC and formaldehyde measurement method

Sampling and measurements of VOC are performed according to ISO 16000-6. Parameters selected for VOC analyses at CSTB are presented in Table 4.

VOC are identified by mass spectrometry (MS) and quantified by flame ionization detector (FID) using their specific response factor when available (specific calibration) or using the toluene response factor (concentrations expressed in toluene equivalent).

The total VOC concentration (TVOC) is calculated as the sum of concentrations of all volatile organic compounds eluting between n-hexane and n-hexadecane (included) quantified using the toluene response factor. The TVOC concentration is expressed in toluene equivalent.

Parameters	Analytical conditions
Thermo desorber	Perkin Elmer ATD 400
Desorption temperature	280 °C
Nitrogen flow rate	50 mL.min ⁻¹
Desorption duration	20 min.
Secondary trap temperature	280 °C
Gas chromatograph / Mass spectrometer	VARIAN GC 3800 / MS Saturn 2000
Temperature cycle	40 °C during 5 min. 2.5 °C / min. up to 170 °C 7.5 °C / min. up to 300 °C 300 °C during 26 min.
Capillary column	DB-5 ms (length : 60 m, internal diameter : 0.25 mm, phase thickness : 1 µm)
FID temperature	270 °C
Mass spectrometer parameters	Trap (MS Saturn 2000) 70 eV 33-450 amu

Table 4 : Analytical conditions for VOC analyses

Sampling and measurements of formaldehyde and other carbonyl compounds are performed according to ISO 16000-3. Parameters for their analysis at CSTB are presented in Table 5.

Sampling is performed by pumping on cartridges filled with silica gel coated with 2,4-dinitrophenylhydrazine (DNPH). After sampling, cartridges are eluted in 5 ml acetonitrile. Two 20 µl injections of this elution solution are analyzed by high performance liquid chromatography (HPLC) on a WATERS Alliance system.

Aldehydes are identified and quantified using specific calibration.

Parameters	Analytical conditions
HPLC system	WATERS Alliance
Detection	UV (wave length : 360 nm)
Capillary column	WATERS Novapack C18 (length : 150 mm, internal diameter : 3.9 mm, phase thickness : 4 µm, pore diameter : 60 Å)
Elution flow rate	1.5 mL·mn ⁻¹
Column temperature	35 °C

6. Test results

Test results presented in this report are the arithmetic means of the 2 sampled and analysed samples. Results are corrected from the chamber blank value measured before introduction of the test specimen in the emission test chamber.

Test results are expressed as area specific emission rates (SER_a , in $\mu\text{g.m}^{-2}.\text{h}^{-1}$), calculated according to EN ISO 16000-9 as:

$$SER_a = C_{\text{meas}} \cdot q_{\text{test}}$$

where C_{meas} are the measured concentrations ($\mu\text{g.m}^{-3}$) and q_{test} the area specific air flow rate during testing (Table 2).

7. Evaluation of VOC and ALD emissions

For the evaluation of VOC and formaldehyde emissions from building products, exposure concentrations in a reference room (C_{exp}) are calculated from area specific emission rates as:

$$C_{exp} = SER_a / q_{scenario}$$

where SER_a are the area specific emission rates ($\mu\text{g.m}^{-2}.\text{h}^{-1}$) and $q_{scenario}$ the area specific air flow rate for the selected conventional evaluation scenario in the model room specified in Order of April 19, 2011 on mandatory labelling (here, "walls" scenario: $q_{scenario} = 0.50 \text{ m}^3.\text{m}^{-2}.\text{h}^{-1}$).
